The evolution of senescence. This paper outlines several areas of current research into the evolutionary factors that drive senescence and how it affects the evolution of life history. As the transition from pre- to post-reproductive survival is regarded as a fundamental event in the evolution of female life history, it is an important phenomenon on which to focus. A framework is outlined that treats senescence as a response to progressive changes in the population or a sum of all actions that result from senescence processes. A definition of senescence is also offered and the conflict between the need for terminal senescence and the ability to maintain fecundity, is discussed. After a survey of the range of senescence processes observed in natural populations, two possible evolutionary scenarios are considered. One of these involves the nature of senescence-related actions in natural populations and the other considers the nature of selection in the context of senescence. The evidence that senescence is a consequence of many actions in natural populations is summarized and an assessment of the degree to which any of these might be selected in the wild is made. Throughout this paper, mechanisms are used to select for the efficiency of senescence and therefore an explanation is given for why such actions as we have described may be selected.

This invention relates to a player jack jack of simple construction that comprises a case base adapted to be applied to a carpet and which contains a pair of internal jacks and a pair of external jacks. When required, the internal jacks may be adapted to accept a telephone handset, a radio, an electric shaver, or the like. The external jacks may be adapted to accommodate a wall telephone or, in an alternative version of the invention, a cellular telephone. The jack jack of this invention is adapted to be applied to a carpet and includes a case base which contains at least two jacks, the case base being adapted to be attached to the carpet to provide a unit that is easily transportable, and providing a generally stable base for one or more objects, such as telephones and the like. One version of the jack jack of this invention comprises a case base that is detachable and is adapted to fit into a recess in a standard jack jack outlet. The jack jack of this invention is also advantageous because it allows a first jack or telephone to be coupled with a second jack or the like for a phone
